PREFACE.

For many years demands have been made upon the Department of Labor for wage statistics of different countries. These demands have come from all sources—Congressional committees, members of the Senate and House, labor organizations, students, and writers. The only answer to the demands which the Department has been able to make is to refer to individual reports here and there. Such an answer, of course, has been very unsatisfactory. Reference could be made to voluminous collections of wage statistics in the past, especially to the valuable report of Dr. Edward Young, chief of the United States Bureau of Statistics of the Treasury Department in 1875, entitled *Labor in Europe and America*, being a special report on the rates of wages, cost of subsistence, and the condition of the working classes in Great Britain, France, Belgium, Germany, and other countries of Europe, as well as in the United States and British America, and to the report (in three volumes) by the honorable Secretary of State, in 1884, of which Volumes I and II, entitled *Labor in Europe*, are made up from the individual reports of consuls of the United States in the several countries of Europe on the rates of wages, cost of living to the laboring classes, etc., and Volume III, entitled *Labor in America, Asia, Africa, Australasia, and Polynesia*, gives reports of consuls in those countries on the same subjects. In neither of these valuable documents, however, are the rates of wages arranged by years or classified by countries in such a way as to serve for ready reference. The Department's own reports, too, have from time to time presented large masses of original wage statistics; but these, being incidental to the general subjects of the reports, have usually been limited to particular periods, industries, or localities.

In order to answer the very numerous demands for information relative to the rates of wages, hours of labor, etc., this Department undertook, nearly seven years ago, the compilation of such information for the commercial countries of the world. It was beyond the means of the Department to collect the desired information from original

sources. We were therefore obliged to content ourselves with a compilation of the information from such authentic official sources as could be secured. The result is the Fifteenth Annual Report of the Commissioner of Labor, in two volumes. It is only what it pretends to be—a compilation. It is, therefore, a work of reference, and not a study of the wage question. The very nature and magnitude of the work have prevented any summary or analysis. Such a summary would have necessitated calculations showing the course of wages in each country for all the years for which any quotations are given, and also for each occupation. It is believed that the method adopted furnishes the requisite fundamental information for all who may have occasion to use it.

The present compilation includes the lowest, highest, and average rates of wages per day and hours of work per week for the United States, and the lowest and highest rates and hours for foreign countries. It gives quotations for each country as far back as any definite official statement was to be found, and the quotations come down to the present year (1900). In all, 714 different reports are represented, and about 900,000 separate quotations, and these have been classified under approximately 4,500 occupations and subdivisions of occupations. The extent of the work involved can be better understood when it is stated that at least 1,500 different official reports have been carefully reviewed in order to secure authentic information. Of course, wage rates were not found in all that number, although 1,250,000 quotations were copied and classified, out of which 900,000 were found sufficiently definite for the purposes of this report. The information is for practically all of the States and Territories of the United States, and for about 100 foreign countries, colonies, and provinces, of which the following is a nearly complete list:

Algeria.	British Guiana.	Cuba.
Antigua.	British Honduras.	Denmark.
Argentina.	British India.	Dutch East Indies.
Australia.	Canada.	Ecuador.
Austria-Hungary.	Canary Islands.	England.
Azores.	Cape of Good Hope.	Egypt.
Bahama Islands.	Ceylon.	Falkland Islands.
Barbadoes.	Chile.	France.
Belgium.	China.	Germany.
Bermuda.	Colombia.	Gibraltar.
Bolivia.	Corsica.	Great Britain. (<i>a</i>)
Brazil.	Costa Rica.	Greece.

a Subdivided under England, Scotland, and Wales whenever possible.

Guadeloupe.	Newfoundland.	Servia.
Hawaiian Islands.	New Zealand.	Siam.
Honduras.	Nicaragua.	Sierra Leone.
Ireland.	Norway.	Spain.
Italy.	Paraguay.	Straits Settlements.
Jamaica.	Persia.	Sweden.
Japan.	Peru.	Switzerland.
Korea.	Philippine Islands.	Tobago Island.
Liberia.	Portugal.	Trinidad.
Luxemburg.	Porto Rico.	Tripoli.
Madagascar.	Russia.	Tunis.
Madeira Islands.	Saint Christopher.	Turkey.
Malta.	Saint Thomas.	Turkey in Asia.
Martinique.	Samoa.	Uruguay.
Mexico.	Santo Domingo.	Venezuela.
Morocco.	San Salvador.	Wales.
Natal.	Scotland.	
Netherlands.	Senegal.	

As the quotations are arranged alphabetically by occupations, an index does not seem to be essential; and, in fact, to make one would expand the size of the report to very great proportions.

As stated in the introduction, the Department disclaims all responsibility for the scientific value of the data compiled, except so far as they are taken from the previous reports and documents issued by it, yet the greatest care has been taken to secure only those statements which have official sanction in the countries from which they emanate.

It is with regret that I have to announce the death of Mr. Oren W. Weaver, who was the chief clerk from the organization of the Bureau of Labor in January, 1885, to April 27, 1900. Mr. Weaver's services have been gratefully acknowledged from time to time. His fidelity to and interest in the work of the Department have been of very great value in its development and in the character of its publications. Mr. G. W. W. Hanger, who came into the Department under civil-service rules at the lowest clerical salary, and who has passed through every grade, was on the death of Mr. Weaver appointed chief clerk, and it is with pleasure that I acknowledge the valuable service he has rendered in the difficult compilation resulting in this report.

CARROLL D. WRIGHT,
Commissioner of Labor.

DEPARTMENT OF LABOR,

Washington, D. C., November 22, 1900.

CHAPTER I.

INTRODUCTION.

CHAPTER I.

INTRODUCTION.

This report is a compilation of the wages and hours of labor of persons engaged in all occupations for all countries of the world for which data have been officially published and for years extending back as far as could be obtained from such data. The work, which required the examination of hundreds of volumes and the copying and classification of thousands of quotations, was begun in 1894, and has been continued at intervals in connection with the other and more pressing work of the Department.

In using this compilation it should be clearly understood that the matter here published has not been gathered by original research or a canvass by the agents of the Department of the establishments in which the persons involved have been engaged (except so far as the data have been drawn from the published reports of the Department), but that it is simply a compilation as to wages and hours of labor of all of the available official publications of the commercial countries of the world. The various data relating to wages which have been published in the various reports of the Department have almost invariably been secured from the pay rolls of the establishments in which the individuals concerned have been employed. In this compilation, however, the Department has no knowledge in most cases as to the manner in which the figures were gathered by the various offices publishing the same, and therefore can be responsible only for quotations from its own reports and for the accuracy of the work of transcribing, editing, and compiling the data from the various reports used. The facts are given as found in the various official publications, with only such changes as were necessary to render the tabulation uniform.

SOURCES.

The data presented in this report, as has been indicated above, have been drawn entirely from official publications, and due credit has been given. The comparatively small number of books of private authorship which contain wage data have been excluded from this compilation, the intention of the Department being to include only such data as have been published with official sanction. The list of these sources is found on pages 21 to '32, immediately preceding the table itself. With a very few exceptions all of the reports of the Federal and State

governments of the United States have been accessible to the Department, and but a small number of foreign reports are known to exist which have not been available for use in this compilation. It will be seen, then, that this compilation may be considered exhaustive for the United States and nearly so for foreign countries.

METHOD OF COMPILING.

In this compilation the data relating to wages found in each of the 714 reports used in the same were transcribed literally upon small working cards. These cards were then classified and tabulated in the form shown in the compilation which follows. In the course of the copying of these data from the various reports it was soon realized that in order to make the data found there of any value in a comparative way it would be necessary to carefully edit and classify the same. Every variety of wording and form of tabulation were found; occupation and industry names were expressed in almost innumerable ways; hours were given for the day, the week, or the month, and wages were given for the hour, the day, the week, the month, or the year. Piece rates have been excluded except in a few cases, as is explained further along. Had the data been compiled literally as found in the various reports, many volumes would have been required to contain the results, occupation names would have numbered into the tens of thousands, and the results themselves would have been so scattered and confusing as to have rendered the report of little practical value. It was necessary, therefore, to edit this heterogeneous matter and put it in such form as would render it valuable when tabulated.

It was intended at first to make a classification by general industries, such as agriculture, manufactures, mining, etc., with subclassifications under each of these general industries—as cotton goods, harness and saddlery, etc., under manufactures—and, finally, under each sub-industry to show the data by occupations. This plan was found open to the objection that the same occupation would be found scattered among several industries, and a study of the occupation itself thus made difficult, if not impossible. Occupations were also frequently found without any reference whatever to the industry with which they were connected, so that they could not have been so classified. It was thought best, therefore, to make no other classification than that by occupations, using the industry only when necessary for additional information, and then as a modifier of the occupation itself. In illustration of the work of editing the occupation, that of “section men, railroad,” may be taken as an example. In the original sources this occupation was found variously worded, as follows: “Section men, railroad;” “section hands, railroad;” “section laborers, railroad;” “track laborers, railroad;” “track repairers, railroad;” “trackmen, railroad;” “laborers on way, railroad;” and “yard laborers, track depart-

ment, railroad." It was thought that all of these expressions covered practically but one kind of work, and inasmuch as the term "section men, railroad," was the predominating one, all the data which were found in connection with the other terms expressing the work of this occupation were combined under the occupation name of "section men, railroad." It will be readily seen that for purposes of comparison such a combination of the data relating to practically the same occupation is much better than an indefinite multiplication of occupation names and thinly scattered data relating to the same.

As an illustration of the various industries in which the same occupation is found, that of blacksmith may be taken. It has been found that of the industries in which blacksmiths are employed the following is a partial list: Agricultural implements, bolt works, bridge works, car building, carriages and wagons, coal mining, cotton mills, engine works, foundry, gas works, glass works, iron furnace, iron mine, machine shop, oil wells, printing-press works, railroad shops, ship-building, tool factory, etc. As has been stated, this is but a small portion of the whole number of industries that might be named wherein blacksmiths were found employed. While it is possible that some might desire to know the wages of blacksmiths in each of the several industries, it is believed that generally the reader would prefer to have the data relating to this occupation condensed rather than spread over the many industries. As the work in this occupation is practically the same, no matter in what industry it may be found, and for the other reasons stated, blacksmiths have been placed in one class, unmodified by industry. If but one, or even a few occupations or industries were to be considered, it would undoubtedly have been advisable to give the data in the greatest detail, as has been done in many individual reports, but in a work of this scope such a course was deemed impracticable. In most of the occupations the distinction between "foreman," "journeyman," and "helper" have been made in the various reports and have been so presented in this compilation. In one of the largest occupations, however, that of machinists, a hopeless tangle was found. It will be seen by the great range of wages that this occupation, as given in the compilation which follows, includes both highly skilled and low-grade labor. The data were thus found in a great many of the sources quoted. In one table alone which was found in a report used in this compilation, approximately 8,000 so-called "machinists" were included. It was seen at once from the wages given that there had been included in this table, under the occupation name of machinist, not only machinists proper, but also foremen of all classes, apprentices, and helpers of the lowest grade as well. The data were thus given in a great many of the sources quoted. There was no possibility of separating the three distinct classes that were positively known to be contained therein—journeymen, foremen, and helpers or

apprentices. As so many foremen and helpers were known, then, to be inseparably included in almost every statement found, the small number reported separately as foremen and helpers were thrown into the general occupation, which must be understood to include all employees on the machinists' roll, from the lowest-paid apprentice to the highest-paid foreman. The value of the data, therefore, for machinists is lessened by reason of this inclusion, but no other course was possible.

In editing the various data found all indefinite statements were omitted entirely, such as wages for all employees of an establishment, and wages for several combined occupations, the intention being to include only those quotations which were for a single specific and reasonably well-defined occupation. A few unimportant occupations having not more than three different quotations have been excluded as being of not sufficient importance to occupy space.

It was often found difficult to determine how broad an expression might be and yet remain specific enough to be considered an occupation name. In this connection it may be stated also that many occupations reasonably specific are yet composite. A large, closely organized establishment may have its working force divided into many classes, while in a similar establishment an occupation may be used to cover several of the more specific ones of the other establishment. For example, one establishment may use the terms "shirt-bosom maker," "collar maker," "shirt maker," etc., while a second establishment may use but the one term "shirt maker," covering the whole labor of making a shirt. There is no doubt also that many employees originally reported and here compiled as sewing-machine operators were engaged in working on shirts. To make a division that the establishment itself had not made, and of which the reports offered no clew, was, of course, impossible.

Foreign occupation names also offered many difficulties. The methods of manufacture and the disposition of employees as regards the specific work done by each were found to differ greatly from the conditions in our own country. In the classification of these occupations the Department has fortunately had the services of experts in its own force, who are thoroughly acquainted with conditions abroad and splendidly equipped for this very work. In regard to these occupation terms the effort has been to ascertain first the specific work represented by each and then classify under the occupation name in our own language which covered the same.

In this editing of occupations it can not be claimed that a perfect classification and wording of the same have been made. To so modify the wording as to bring together the facts for an occupation and still preserve the meaning was a difficult task, owing to the great number of synonymous terms and fine shades of meaning found. Taking into

consideration the differences and uncertainties found in the material from which this compilation has been made, however, coming as it does from hundreds of sources, and being expressed in a number of languages, it is believed that the best that is possible has been done.

CONVERSION OF WAGES EXPRESSED IN FOREIGN MONEYS.

It was not expected that any great difficulty would be encountered in converting into the United States equivalent wages which were expressed in foreign moneys, but when this work was taken up it was found that many difficulties existed. The United States itself has not been on a stable, uniform monetary basis during the whole period of its existence. Since 1792 the United States gold coins have been changed twice, and one slight change has been made in the silver dollar. Much of the paper money which was in circulation before the civil war was depreciated, and Government notes fluctuated in their ratio to gold from 1862 to 1878. All of the quotations found in the various United States and State reports are presented in this compilation in the kind of money given in the original sources. Inasmuch as these sources were uniformly silent as to the kind of money in which wages were paid, the Department has not felt itself warranted in making any reduction or change in the figures from these sources. It may fairly be presumed, however, that a dollar means a representative dollar of the date and State quoted, and it may also be presumed that quotations from 1862 to 1878 are in paper currency, except possibly in the Pacific coast States. For the convenience of those who may wish to know the average value of United States gold in paper currency in the years from 1862 to 1878, the following table, published by the United States Treasury Department, is presented:

AVERAGE VALUE OF UNITED STATES GOLD IN PAPER CURRENCY, 1862 TO 1878

Year.	Average value, for calendar year, of \$100 gold in paper currency in New York market.	Year.	Average value, for calendar year, of \$100 gold in paper currency in New York market.
1862	\$113.3	1871.....	\$111.7
1863	145.2	1872.....	112.4
1864	203.3	1873.....	113.8
1865	157.3	1874.....	111.2
1866	140.9	1875.....	114.9
1867	138.2	1876.....	111.5
1868	139.7	1877.....	104.8
1869	133.0	1878.....	100.8
1870	114.9		

The greater part of the foreign wage quotations were found expressed in the pound sterling, the franc, and the mark. These and some other monetary units of foreign countries have remained unchanged for years and were easily converted into the United States equivalent.

Other monetary units, however, were found that were not so readily converted. Among them were the old English, German, Norwegian, Dutch, and Austrian moneys, and the ever shifting moneys of Japan, China, Mexico, India, etc. All foreign moneys have been converted into the United States gold equivalent, and this should be constantly borne in mind in making comparison of domestic and foreign wages. The pound sterling has from 1816 up to the present time contained the same amount of gold, and manifestly in order to compare English wages for one year with another the pound must be given a uniform valuation during that period. For this reason the fluctuations of exchange have been ignored and the conversion made uniformly on the basis of \$4.8665 as the equivalent of one pound sterling. Before 1816 there may be a doubt as to the value of the pound, but after consulting several authorities on this subject it has been thought best to use the same valuation back to 1717. The few quotations for years previous to 1717 have been omitted as being too doubtful for conversion.

The French franc has been unchanged for many years, and in this compilation has been converted at 19.3 cents. The franc of other countries, the lira, the mark, crown, and some other foreign monetary units, have fixed values running back for a shorter period of time. In converting fluctuating moneys the valuations have been taken from the regular published statements of the United States Treasury. In converting old-style moneys and moneys but little used or known the valuations have been taken from the Statesman's Yearbook and through the English converted into United States money.

YEAR COVERED.

The year tabulated is the year in which the wages quoted were paid. On this subject many reports were perfectly clear. The statement was clearly and positively made, either in the introduction of the book or in connection with the wages, as to the exact year of the data. Other reports, however, were absolutely silent on the question, and it could only be presumed in these cases that the wages were for the year of publication. Biennial reports gave particular trouble in this respect, some furnishing information as to the year to which the data applied, which might be either one or both of the years covered by the report, while others made no mention of the particular year. In the latter case the second year of the two nominally covered by the report was fixed on as the year to which the data applied.

LOCALITY.

Had the data in all cases been given it would no doubt have added to the value of the compilation to have included information as to the city or county in the State of the United States, and the province or

city in foreign countries, to which each quotation applied. This information, however, was given in but a small proportion of the instances, and it was found impracticable to publish the quotations other than by State or country.

SEX.

Many of the reports which furnished data as to wages plainly stated the sex of the persons for whom wages were shown. Other reports were either entirely silent on this subject or furnished information with reference to but part of the data given. Frequently two quotations were found in the same report for the same occupation, as, for instance, blacksmiths. With one quotation the sex was given; with the other quotation, of an equal or even higher rate, no statement was made as to sex. Rather than use two lines in the tabulation of this statement—one for “males” and one for “sex not reported”—it was thought better to assume that the second quotation was for a male person and combine the two in one average when everything appeared to support the correctness of the assumption.

HOURS OF LABOR.

The hours of labor were reported generally by the day or week, although occasionally they were given by the month. For the sake of uniformity it was necessary to reduce all these statements to a common basis, and to do this it was necessary to determine the days of work per week in all occupations. It is quite possible that some error of judgment has occurred in this classification, although it is thought that this has occurred in but few cases. Hours per day have been changed to hours per week by multiplying by 6 or by 7, as the occupation was stated or was presumed to be one of six or seven days per week.

RATES OF WAGES.

Rates were found reported by the hour, day, week, month, or year—in some cases by the piece. Piece rates, however, were excluded, except for a few occupations having piece-rate units generally understood. In order to secure uniformity of tabulation it was found necessary to reduce all time rates to a common basis. In most instances these rates were given by the day, and for this reason all rates were reduced to this basis. In many cases it was stated that the occupation was one in which work was carried on either six or seven days per week. Where this was not stated, however, it was necessary to arbitrarily class the quotation for a given occupation as engaged six or seven days per week, and this has been done in some instances. Weekly wages were reduced to daily by dividing by 6 or 7, as the case was known or presumed to be. Monthly rates were

reduced by multiplying by 12 and dividing by 313 or 365, while yearly rates were reduced by dividing by 313 or 365, as the case might be. The table shows the lowest and highest rates reported, and in data for the United States the average rate is also given.

No quotations were accepted for the United States unless the number of employees was given, and with such data it was possible to secure a scientific average. It was found, however, that if the same rule were applied to foreign data comparatively few quotations could be secured, inasmuch as a very large proportion of the quotations from foreign reports were not accompanied by data as to the number of employees. It will be clearly seen that a true average could be computed only by multiplying each rate by the number engaged thereat, adding the products, and dividing the sum by the whole number of persons considered. The number of employees, as has been stated, was seldom given with foreign quotations; hence the true average could seldom be computed for these data. Owing to this fact it was deemed best to omit both the number of persons and the average in the few cases where they might have been given. The effort was made by the study of a number of occupations to determine upon a representative mean rate in connection with foreign quotations to correspond with the true average of domestic wages. After considerable work in this direction, however, it was found that anything which could be selected would probably be incorrect and misleading, and for this reason the attempt to select such a representative mean rate was discontinued. The lowest and highest rates given are the lowest and highest found. They must not be considered as the exact lowest and highest uniformly, for the reason that many reports appeared to be careless in their presentation, wages being given without any statement as to whether actual or average. The reader, therefore, can only infer from the appearance of the data whether the quotation represents an actual rate paid, an average rate paid, or average earnings. The attempt was made in copying these data to designate in every instance whether the rate was actual or average, but it was found practically impossible to do so with any certainty, as statements were not often made as regards this point. It will thus be seen that the figures which are given for lowest and highest may themselves be averages, the lowest and highest rates found in this report being here presented as lowest and highest.

ARRANGEMENT OF COMPILATION.

A systematic arrangement of the compilation was of course necessary to make it readily usable. The arrangement adopted is as follows: (1) The occupation classification is the first one, the occupations being arranged strictly in alphabetical order; (2) under each occupation the years are arranged in order, the earliest years appearing first; (3) under each year the States are given in alphabetical order, and

these are followed by foreign countries arranged in a similar manner; (4) under each State or foreign country the sources of the information are then given; (5) under each source the sexes are arranged in the order of male, female, and not reported; (6) the hours of labor per week and the wages per day are then presented for each sex class.

MANNER IN WHICH COMPILATION SHOULD BE USED.

The following example shows the method of using the compilation:
 Let us suppose that it be desired to find the wages of carpenters in Great Britain in 1893. First find the table for carpenters, which appears in alphabetical order among the other occupations; follow the column for years until 1893 is found; follow the States and countries in 1893 until Great Britain is reached. Here it is found that according to information derived from report No. 578 male carpenters worked from 50 to 54 hours per week, and earned from \$1.61 to \$1.73 per day. Turning to the list of sources on page 29, report No. 578, which furnishes the quotation, is found to be Report on the Strikes and Lock-outs of 1892, published by the Labor Department of the Board of Trade.

For a more complete understanding as to the form of the general table a section of that portion relating to boiler makers is given below:

BOILER MAKERS.

Year and State or country.	Re- p't No.	Num- ber and sex of em- ploy- ees.	Lowest, highest, and average—	
			Hours of work per week.	Rates of wages per day (dollars).
1839 England ..	562	(a) M.	58-58-58	0.89-0.89-0.89

a Not reported.

The above section relates to the wages paid boiler makers for the years from 1839 to 1857. As will be seen, no wages for this occupation in the United States prior to 1844 were found. The first line shows that the report, numbered 562 furnished a quotation for England for 1839; by reference to page 29, the specific name of the report numbered 562 is found to be "Miscellaneous Statistics of the United Kingdom, 1856-58," published by the Board of Trade of Great Britain. On the next line report 564 is quoted. This is found in the list of sources to be "Miscellaneous Statistics of the United Kingdom, 1859-61." The first report shows that boiler makers, the number not being reported, worked 58 hours per week and were paid 89 cents per day in England in 1839, while the second report shows that boiler makers, number not reported, worked 61 hours per week in England in 1840, and were paid wages as low as 61 cents and as high as \$1.01 per day. Taking up the year 1856, for which data for both domestic and foreign wages are given, it will be seen that the data for the different States of the United States are given first, and these are followed by the data for foreign countries. The first statement for this year is for the State of Connecticut, and shows that the data were secured from the report numbered 190, which was that of the United States Senate Committee on Finance, entitled "Wholesale Prices, Wages, and Transportation." As in all domestic wages shown in this compilation, the number of the employees covered is given. In this particular instance 24 employees are included who are males, and the final columns show that the hours of labor worked per week were uniformly 60, while the lowest rate of pay was \$1.20 per day, the highest \$2.37, and the average \$1.59. The data relating to other States and countries, for which quotations were found, may be used in a similar manner.

The list of the official reports from which wage data were secured, together with the report number relating to each, which will enable the reader to find the specific name of any report referred to in the table, will be found in this volume immediately preceding the table. This list may also be found immediately preceding the continuation of the table in Volume II of the report. Immediately following the specific name of each report is found (inclosed in a parenthesis) the date of publication of the report.

OFFICIAL REPORTS FROM WHICH WAGE DATA WERE SECURED.
